

SPECIFICATION

TO ALL WHOM IT MAY CONCERN:

BE IT KNOWN THAT GORDON KO, a citizen of the United States,
residing at Phillips Ranch, California, has invented new and useful

SHIELD PADS FOR VEHICLE DOORS AND SIDES

of which the following is a specification:

BACKGROUND AND SUMMARY OF THE INVENTION

5 The present invention provides protective shields to absorb impacts and prevent damage to vehicle doors and sides, which may typically be caused by impacts from doors of adjacently parked vehicles, particularly when such doors are opened with excessive force.

10 Protective shields or pads of the prior art for protection of vehicle sides and doors are characterized by a variety of shortcomings and defects. Many such devices are too expensive to manufacture to be appropriate for broad application to a general market. Some do not function adequately to protect sides and doors from dents and scratches, and many provide protection only to a limited area because of their relatively small size. Many require substantial time and effort to install, to remove, and to package and store.

15 According to the present invention, a removably attachable shielding is provided for vehicle sides and doors, which typically comprises two shield pads of impact-absorbing material to protect the doors and side surfaces of vehicles from impact dents and scratches, such as are caused by impacts by doors of adjacent vehicles. The shield pads are formed of impact-absorbing material, and are removably attached to a vehicle, typically by two suction cups on each pad.

At least one strap, and typically two straps, are attached to the lateral edge portions of the shield pads to attach them together. An elastic strap is secured at an edge portion of one pad and is detachably securable to the other pad by snap-fasteners having cooperating portions on each pad or by Velcro fastener portions on the pads and on an end portion of the elastic strap, thus to provide for retaining pads when rolled up by the strap being secured thereabout. These features enable ease of handling, rolling up, storing, handling, and maneuvering of the shield pads.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a perspective view showing shield pads of the invention attached to the interior of a vehicle windshield by suction cups;

5 Figure 2 is an elevational view of an automotive vehicle with two shield pads according to the invention attached to the doors and sides of the vehicle by suction cups on the pads;

Figure 3 is a perspective view of the pads of Figures 1 and 2 rolled up together and secured by an elastic strap;

10 Figure 4 is an elevational view of two shield pads attached together by straps;

Figure 5 is an elevational view of a pad according to the invention with suction cups thereon and an elastic strap extending therefrom;

15 Figure 6 is a perspective view of shield pads of Figure 4 rolled up together and secured by an elastic strap; and

Figure 7 is an enlarged sectional view of a suction cup attached to a shield pad.

DESCRIPTION OF THE PREFERRED EMBODIMENT

The present invention relates to shields removably attached to vehicle doors and or sides to prevent dents and scratches which may typically be caused by the opening of doors of adjacent vehicles to impact a side or door of the vehicle.

Referring to the drawings, a preferred embodiment of the present invention comprises shields or pads 12, 14 which are interconnected by spaced-apart straps 16, 18 which are secured, as by riveting, to the shield pads, as shown (Figs. 2 and 4). The shield pads are formed of impact-absorbing material which may comprise a blend of neoprene rubber, ethylene propylene, or styrene butatene rubber. A preferred material is ethylene vinyl acetate or "EVA".

Each shield pad has spaced-apart suction cups 20, 22 thereon for detachably mounting the shield panel on glass or painted metal surfaces of a vehicle. Figure 7 shows a suction cup 20 in cross-section. An elastic band or strap 24 is secured, as by riveting, to a lateral edge portion of shield pad 14 and has on its outer end portion a snap-fastener member 26. A mating snap-fastener component 28 is disposed on the shield pad.

The elastic band 24 has at its outer end a snap-fastener component engageable with a cooperating component 28, one component being male and the other female. The components cooperate to

effect the wrapping and securing of the pads together.

Alternatively, Velcro fastener elastic band component 25 may engage end portions of shield pad, and cooperate with Velcro components on the strap and on the shield pads. Rolled-up pads are thus secured together by the elastic band, thus to provide ease of handling, maneuvering and rolling up of the shield pads.

Each of the two shield pads may be used separately from the other shield pad by simply disengaging snap-fastener components of Velcro connections between the straps and shield pads end portions.

The shields of the invention may serve as sunshades when mounted on the windshield of a vehicle. The shield pads may typically be supported atop an instrument panel of a vehicle with the suction cups on their upper portions attaching the pads to the upper portion of the windshield, as indicated in Figure 1. The visors adjacent to the vehicle windshield may also serve to retain the pads with or without utilizing the suction cups.

It will be understood that various changes and modifications may be made from the preferred embodiments discussed above without departing from the scope of the present invention, which is established by the following claims and equivalents thereof.
